

AI Engineer | RAG, AI Agents & Backend Systems

AI engineer focused on grounded, tool-using systems. I build local RAG applications, AI services backed by live application data, and evaluation and approval boundaries for agent workflows. My backend foundation in Python, FastAPI, SQL, Docker, and API design supports reliable AI products.

PROFESSIONAL EXPERIENCE

FlyRank - AI Engineer Intern | July 2026 – Present

- Built backend services covering API design, database integration, authentication, layered architecture, testing, and containerization.
- Shipped a source-grounded research workflow (draft → critique → revision → human review), tested with five real inputs.
- Python, FastAPI, SQLite, PostgreSQL, Docker, Claude.

Project: SafeBump

- Built an agent that upgrades pinned Python dependencies one at a time, validating each change against the project's tests and pip check before keeping or rolling it back.
- Automatic rollback with recorded reason on failure; human approval required for pushes, PRs, and major upgrades.
- Defined five evaluation cases before writing code, ran them against the finished agent, and documented where verification stops short of proving safety.
- Python, pytest, pip-audit, Git, subprocess orchestration on Linux.

Microsoft Türkiye AI Innovators — Program Participant | June 2026 – July 2026

Project: Foundry Local RAG Assistant

- Developed the Foundry Local RAG Assistant, a privacy-focused AI application that allows users to upload documents and receive answers based on their own content without sending it to a cloud service.
- Built both web and command-line interfaces and developed the complete flow from document processing to evidence-based answer generation.
- Used Python, FastAPI, SQLite, Foundry Local, and RAG. The system scored 8/10 on development questions and 7/10 on a blind evaluation, supported by 38 automated tests.

VBT Software — Software Developer Intern | June 2026 – July 2026

- Received practical training in full-stack development, software-development processes, teamwork, testing, and project delivery.

Project: PetAdopt

- Co-developed a pet-adoption platform that helps adopters discover suitable animals and enables administrators to manage adoption records and platform content.
- Built an AI assistant that collects adopters' preferences, evaluates their text and image input, and matches them with suitable animals from real database records.
- Owned the backend services, database structure and seed data, AI service, Docker setup, continuous integration, API testing, technical documentation, and parts of the Flutter administration application.
- Used Python, FastAPI, PostgreSQL, Claude API, Flutter, Docker, GitHub Actions, and REST APIs.

Software Persona — Software Developer Intern | March 2026 – April 2026

Project: NovaStore

- Developed backend services for an e-commerce application where users can manage accounts, browse products, and complete product-related workflows.
- Integrated an AI assistant to support customer questions and provide product recommendations.
- Used Python, FastAPI, MSSQL, REST APIs, React, and Flutter.

EDUCATION

- BSc, Management Information Systems (Ongoing) — Istanbul University
- BSc, Finance — Eskisehir Osmangazi University

SKILLS

AI Engineering:

- RAG, AI agents, tool calling, structured outputs, evaluation, prompt engineering, Claude API, Foundry Local

Backend:

- Python, FastAPI, Pydantic, SQLAlchemy, Node.js, Express.js, REST, OpenAPI

Data & Infrastructure:

- PostgreSQL, SQLite, MSSQL, MySQL, Docker Compose, GitHub Actions, Git

CERTIFICATIONS & LANGUAGES

- Anthropic Academy — 20 completed courses and certificates

Selected certificates:

- Claude with the Anthropic API
- Model Context Protocol: Advanced Topics
- Introduction to Agent Skills
- Introduction to Subagents
- AWS Cloud Practitioner Essentials
- IBM & Kodluyoruz CyberStart

Languages:

- English (Intermediate) | Turkish (Native)
